

T9® Solutions

Making mobile communications experiences faster, easier and more fun.

T9® software has set the bar for mobile usability, creating mobile user experiences that help drive consumer demand for and use of mobile communications devices and services.

Launched in 1995, the T9® flagship text input product is one of the core offerings within AOL's wireless division. Today, more than 800 mobile phone models around the world include T9 software and the technology has been licensed to major consumer electronics and communications equipment manufacturers worldwide. T9 software is supported globally with offices in Seattle, London, Paris, Hong Kong, Beijing, Tokyo, Seoul, Bangalore and São Paulo.

Products:

T9® Text Input:

T9 Text Input has revolutionized the way people use wireless phones, providing an innovative solution for entering text on small, wireless devices not able to support full keyboards. T9 Text Input gives the 9 keys found on a wireless phone the power of a full QWERTY keyboard. T9 software is now a leading standard for mobile text input, embedded on the majority of all mobile handsets worldwide.

T9® Text Output:

T9 Text Output is a best-in-class text output product that integrates easily with the T9® engine. T9 Text Output provides robust font rendering and editing capabilities. This includes support for languages that have complex rules for rendering, particularly bidirectional languages such as Arabic and Hindi. Using one engine that works with more than 25 languages, it allows OEMs to quickly adapt a device's language rendering capability for each market.

XT9™ Mobile Interface:

The new XT9 Mobile Interface is the first of its kind: a multi-modal user interface solution for feature-rich smartphones and advanced mobile devices. XT9™ software is designed to enable users to easily switch between input modes, including traditional phone keypad, hard and soft QWERTY keyboard, as well as handwriting and speech, making it faster and easier to input text. By making seemingly complex wireless features uncomplicated, XT9 Mobile Interface has the potential to drive worldwide demand for and usage of mobile communications services.

T9 software defines text input. That's why T9 solutions are the clear choice in mobile messaging and for use in advancing wireless data services.

- > Proven expertise in design, maintenance and distribution of embedded software
- > Consistent, demonstrated and unequalled knowledge in natural UI technologies
- > The industry's most extensive in-house language experience
- > Strong business and technical relationships with OEMs/ODMs and mobile operators around the world

Today, the T9® portfolio continues to evolve with innovative solutions – always focused on making mobile communications easier and mobile devices smarter.
